# EXISTENCE OF WEAK-RENORMALIZED SOLUTION FOR A NONLINEAR SYSTEM 

B. CLIMENT

#### Abstract

We prove an existence result for a coupled system of the reactiondiffusion kind. The fact that no growth condition is assumed on some nonlinear terms motivates the search of a weak-renormalized solution.

## 1 Introduction. Description of the problem

This paper investigates the existence of a solution for the nonlinear system

$$
\left\{\begin{array}{cc}
-\Delta u-\nabla \cdot\left(\beta(v) X^{\prime}(u)\right)=f & \text { in } \Omega,  \tag{1}\\
-\Delta v-\nabla \cdot\left(\beta^{\prime}(v) X(u)\right)=g & \text { in } \Omega, \\
u=0, \quad v=0 & \text { on } \partial \Omega,
\end{array}\right.
$$

where $\Omega$ denotes a bounded open subset of $\mathbb{R}^{N}, X$ is a $C^{1}$ bounded $\mathbb{R}^{N}$-valued function on $\mathbb{R}$, i.e.

$$
\begin{equation*}
X \in\left(C^{1}(\mathbb{R})\right)^{N} \cap\left(C_{b}^{0}(\mathbb{R})\right)^{N} \tag{2}
\end{equation*}
$$

$\beta$ is a function whose second derivatives are bounded, i.e.

$$
\begin{equation*}
\beta \in W^{2, \infty}(\mathbb{R}) \tag{3}
\end{equation*}
$$

and

$$
\begin{equation*}
f, g \in H^{-1}(\Omega) \tag{4}
\end{equation*}
$$

Here, the main difficulty to find a solution is that no growth restrictions are assumed on $X^{\prime}$. Since $f$ and $g$ belong to $H^{-1}(\Omega)$, it is natural to look for solutions $u$ and $v$ belonging to $H_{0}^{1}(\Omega)$. Thus, it is not clear how
to give a sense to $\nabla \cdot\left(\beta(v) X^{\prime}(u)\right)$. This inconvenient can be overcome by introducing a weak-renormalized formulation of this problem, essentially obtained through pointwise multiplication of the first equation of (1) by $h(u)$, where $h$ belongs to $C_{0}^{1}(\mathbb{R})$, that is, $h \in C^{1}(\mathbb{R})$ and its support is compact.

Remark. We can view this system as a simplified model of a nonlinear elasticity problem characterized by a constitutive law of the form

$$
\sigma=\sigma_{l}+Y(u)
$$

where

$$
\left(\sigma_{l}\right)_{i j}=\sum a_{i j k l} \varepsilon_{k l}(u), \quad \varepsilon_{k l}(u)=\frac{1}{2}\left(\frac{\partial u_{k}}{\partial x_{l}}+\frac{\partial u_{l}}{\partial x_{k}}\right), \quad Y_{i j} \in C^{0}\left(\mathbb{R}^{2}\right)
$$

Indeed, the conservation of momentum reads

$$
\nabla \cdot \sigma=F
$$

( $F$ is given), which is in some sense a generalization of (1). In this paper, we study the case in which

$$
Y(u)=\left(\begin{array}{ll}
\beta\left(u_{2}\right) X_{1}^{\prime}\left(u_{1}\right) & \beta^{\prime}\left(u_{2}\right) X_{1}\left(u_{1}\right) \\
\beta\left(u_{2}\right) X_{2}^{\prime}\left(u_{1}\right) & \beta^{\prime}\left(u_{2}\right) X_{2}\left(u_{1}\right)
\end{array}\right)
$$

## 2 The main result

Theorem 2.1. Under the assumptions (2), (3), (4), there exists $\{u, v\}$, with $u, v \in H_{0}^{1}(\Omega)$, such that the second equation in (1) is satisfied in the usual weak or distributional sense and the first equation holds in the following sense:

$$
\left\{\begin{align*}
-\nabla \cdot & (h(u) \nabla u)+\nabla u \cdot \nabla h(u)-\nabla \cdot\left(\beta(v) h(u) X^{\prime}(u)\right)  \tag{5}\\
& +\beta(v) X^{\prime}(u) \cdot \nabla h(u)=f h(u) \text { in } \mathcal{D}^{\prime}(\Omega) \quad \forall h \in C_{0}^{1}(\mathbb{R}) .
\end{align*}\right.
$$

A couple $\{u, v\}$ as above will be called a weak-renormalized solution to (1).

Remark. In (5), every term belongs to $\mathcal{D}^{\prime}(\Omega)$. Indeed, $h(u)$ belongs to $H_{0}^{1}(\Omega)$, the first term is in $H^{-1}(\Omega)$. The second one is in $L^{1}(\Omega)$. For instance, since $h$ has a compact support, we can put

$$
h(u) X^{\prime}(u)=h(u) X^{\prime}\left(T_{M}(u)\right) \quad \text { and } \quad h^{\prime}(u) X^{\prime}(u)=h^{\prime}(u) X^{\prime}\left(T_{M}(u)\right)
$$

for some $M>0$, where $T_{M}$ is the usual truncation at level $M$. Thus, we see that the third term in the left belongs to $W^{-1, \infty}(\Omega)$ and the fourth term belongs to $L^{2}(\Omega)$.
Remark. Renormalized solutions to PDE's were introduced by R. DiPerna and P.L. Lions in [4] in the framework of the Boltzmann equation. They have been used in connection with various nonlinear elliptic equations by P. Benilan et al. [2], L. Boccardo et al. [3] and P.L. Lions and F. Murat [6] (see also [7]). In the analysis of existence results for systems, weak-renormalized solutions were first considered by R. Lewandowski [5] (see also [1]).

In this paper, in order to solve (1), we will extend the techniques used in [3] in the context of a single equation.

Remark. With regard to uniqueness, it is an open problem. If we follow the classical argument of considering two solutions $u^{i}, v^{i}$ for $i=1,2$ of (1), and we compute the difference of (5) written for $u^{1}, v^{1}$ and for $u^{2}, v^{2}$, we find expressions with terms of the form $X^{\prime}(\cdot) u$ that we are not able to estimate. There is another argument, due to P. L. Lions and F. Murat [7], which leads to the uniqueness of renormalized solutions, but it cannot be applied here.

## 3 The proof of theorem 2.1

First step. The introduction of a family of approximations.
For each $\varepsilon>0$, let us put $X^{\varepsilon}(s)=X\left(T_{1 / \varepsilon}(s)\right)$ for all $s \in \mathbb{R}$. We will introduce the following approximation to (1):

$$
\begin{cases}-\Delta u^{\varepsilon}-\nabla \cdot\left(\beta\left(v^{\varepsilon}\right)\left(X^{\varepsilon}\right)^{\prime}\left(u^{\varepsilon}\right)\right)=f \quad \text { in } \Omega,  \tag{6}\\ -\Delta v^{\varepsilon}-\nabla \cdot\left(\beta^{\prime}\left(v^{\varepsilon}\right) X\left(u^{\varepsilon}\right)\right)=g \quad \text { in } \Omega, \\ u^{\varepsilon}, v^{\varepsilon} \in H_{0}^{1}(\Omega) & \end{cases}
$$

In order to solve (6), we will apply Schauder's theorem. Thus, for any given $\varepsilon$ and $\{u, v\} \in L^{2}(\Omega) \times L^{2}(\Omega)$, we set $R^{\varepsilon}(\{u, v\})=\left\{u^{\varepsilon}, v^{\varepsilon}\right\}$, with $\left\{u^{\varepsilon}, v^{\varepsilon}\right\}$ being the unique solution to the linear system

$$
\left\{\begin{align*}
&-\Delta u^{\varepsilon}=f+\nabla \cdot\left(\beta(v)\left(X^{\varepsilon}\right)^{\prime}(u)\right) \quad \text { in } \Omega,  \tag{7}\\
&-\Delta v^{\varepsilon}=g+\nabla \cdot\left(\beta^{\prime}(v) X(u)\right) \quad \text { in } \Omega, \\
& u^{\varepsilon}, v^{\varepsilon} \in H_{0}^{1}(\Omega),
\end{align*}\right.
$$

Obviously, $R^{\varepsilon}=R_{3} \circ R_{2} \circ R_{1}^{\varepsilon}$, where

- $R_{1}^{\varepsilon}: L^{2}(\Omega) \times L^{2}(\Omega) \mapsto H^{-1}(\Omega) \times H^{-1}(\Omega)$ is the nonlinear continuous mapping given by

$$
\left\{\begin{array}{l}
R_{1}^{\varepsilon}(\{u, v\})=\left\{f+\nabla \cdot\left(\beta(v)\left(X^{\varepsilon}\right)^{\prime}(u)\right), g+\nabla \cdot\left(\beta^{\prime}(v) X(u)\right)\right\} \\
\quad \forall\{u, v\} \in L^{2}(\Omega) \times L^{2}(\Omega)
\end{array}\right.
$$

- $R_{2}: H^{-1}(\Omega) \times H^{-1}(\Omega) \mapsto H_{0}^{1}(\Omega) \times H_{0}^{1}(\Omega)$ associates to each $\{f, g\} \in H^{-1}(\Omega) \times H^{-1}(\Omega)$ the unique solution $\{w, z\}$ of the following linear system

$$
\left\{\begin{array}{c}
-\Delta w=f \quad \text { in } \Omega \\
-\Delta z=g \quad \text { in } \Omega \\
w, z \in H_{0}^{1}(\Omega)
\end{array}\right.
$$

- $R_{3}$ is the compact embedding of $H_{0}^{1}(\Omega) \times H_{0}^{1}(\Omega)$ into $L^{2}(\Omega) \times L^{2}(\Omega)$.

Since $R_{1}^{\varepsilon}$ maps the whole space $L^{2}(\Omega) \times L^{2}(\Omega)$ inside a ball, Schauder's theorem can be applied and (6) possesses at least one solution $\left\{u^{\varepsilon}, v^{\varepsilon}\right\}$.
Second step. A priori estimates and weak convergence.
Choosing $u^{\varepsilon}$ and $v^{\varepsilon}$ as test functions in the first and second equation in (6) respectively, one finds:

$$
\begin{align*}
\int_{\Omega} \nabla u^{\varepsilon} \nabla u^{\varepsilon}+\int_{\Omega} \beta\left(v^{\varepsilon}\right)\left(X^{\varepsilon}\right)^{\prime}\left(u^{\varepsilon}\right) \cdot \nabla u^{\varepsilon}=\left\langle f, u^{\varepsilon}\right\rangle_{H^{-1}, H_{0}^{1}} .  \tag{8}\\
\int_{\Omega} \nabla v^{\varepsilon} \nabla v^{\varepsilon}+\int_{\Omega} \beta^{\prime}\left(v^{\varepsilon}\right) X\left(u^{\varepsilon}\right) \cdot \nabla v^{\varepsilon}=\left\langle g, v^{\varepsilon}\right\rangle_{H^{-1}, H_{0}^{1}} . \tag{9}
\end{align*}
$$

For $\varepsilon$ sufficiently small, $X=X \circ T_{1 / \varepsilon}=X^{\varepsilon}$, whence we can replace $X\left(u^{\varepsilon}\right)$ by $X^{\varepsilon}\left(u^{\varepsilon}\right)$ in (9).

Let us introduce the function $H=\left(H_{1}, H_{2}, \ldots, H_{n}\right)$, with

$$
H_{i}(t, s)=\int_{0}^{s} \beta(0)\left(X_{i}^{\varepsilon}\right)^{\prime}(\theta) d \theta+\int_{0}^{t} \beta^{\prime}(\theta) X_{i}^{\varepsilon}(s) d \theta
$$

Then,
$\int_{\Omega} \beta\left(v^{\varepsilon}\right)\left(X_{\varepsilon}\right)^{\prime}\left(u^{\varepsilon}\right) \cdot \nabla u^{\varepsilon}+\int_{\Omega} \beta^{\prime}\left(v^{\varepsilon}\right) X_{\varepsilon}\left(u^{\varepsilon}\right) \cdot \nabla v^{\varepsilon}=\int_{\Omega} \nabla \cdot H\left(u^{\varepsilon}, v^{\varepsilon}\right)=0$
thanks to Stokes' theorem. Summing (8) and (9), we obtain

$$
\int_{\Omega}\left|\nabla u^{\varepsilon}\right|^{2}+\int_{\Omega}\left|\nabla v^{\varepsilon}\right|^{2}=\left\langle f, u^{\varepsilon}\right\rangle_{H^{-1}, H_{0}^{1}}+\left\langle g, v^{\varepsilon}\right\rangle_{H^{-1}, H_{0}^{1}}
$$

and

$$
\left\|u^{\varepsilon}\right\|_{H_{0}^{1}}^{2}+\left\|v^{\varepsilon}\right\|_{H_{0}^{1}}^{2} \leq\|f\|_{H^{-1}}^{2}+\|g\|_{H^{-1}}^{2}
$$

Consequently, at least for a subsequence, still indexed by $\varepsilon$, we can conclude that

$$
\begin{align*}
& u^{\varepsilon} \rightarrow u, v^{\varepsilon} \rightarrow v \quad \text { weakly in } H_{0}^{1}(\Omega)  \tag{10}\\
& u^{\varepsilon} \rightarrow u, v^{\varepsilon} \rightarrow v \quad \text { strongly in } L^{p}(\Omega) \quad \forall p \in\left[1,2^{\star}\right) \text { and a.e. }
\end{align*}
$$

Here, we have denoted by $2^{\star}$ the exponent furnished by the Sobolev embedding theorem, that is

$$
\left\{\begin{array}{l}
2^{\star}=\frac{2 N}{N-2} \quad \text { if } N \geq 3 \\
2^{\star}<+\infty \text { arbitrarily large if } N=2
\end{array}\right.
$$

Third step. The strong convergence of $v^{\varepsilon}$ in $H_{0}^{1}$.
It is easy to see that $v$ is a weak solution to the problem

$$
\left\{\begin{array}{l}
-\Delta v-\nabla \cdot\left(\beta^{\prime}(v) X(u)\right)=g \quad \text { in } \Omega  \tag{11}\\
v=0 \quad \text { on } \partial \Omega
\end{array}\right.
$$

Indeed, since $\beta^{\prime}$ and $X$ are continuous and bounded, it is clear that $\beta^{\prime}\left(v^{\varepsilon}\right) \rightarrow \beta^{\prime}(v)$ strongly in $L^{p}$ for all $p \in\left[1,2^{\star}\right)$ and $X\left(u^{\varepsilon}\right) \rightarrow X(u)$
strongly in $L^{r}$ for all $r \in[1,+\infty)$. This enables us to pass to the limit in the second equation in (6).

From (11), we also see that

$$
\begin{equation*}
\int_{\Omega}|\nabla v|^{2}=-\int_{\Omega} \beta^{\prime}(v) X(u) \cdot \nabla v+\int_{\Omega} g v . \tag{12}
\end{equation*}
$$

Let us use $v^{\varepsilon}$ as a test function in the second equation in (6). We find:

$$
\begin{equation*}
\int_{\Omega}\left|\nabla v^{\varepsilon}\right|^{2}=-\int_{\Omega} \beta^{\prime}\left(v^{\varepsilon}\right) X\left(u^{\varepsilon}\right) \cdot \nabla v^{\varepsilon}+\int_{\Omega} g v^{\varepsilon} . \tag{13}
\end{equation*}
$$

Arguing as above, we can pass to the limit in the right hand side in (13). Accordingly, we have:

$$
\int_{\Omega}\left|\nabla v^{\varepsilon}\right|^{2} \rightarrow-\int_{\Omega} \beta^{\prime}(v) X(u) \cdot \nabla v+\int_{\Omega} g v .
$$

This, combined with (12), gives the convergence in norm in $H_{0}^{1}$ for $v^{\varepsilon}$ and, consequently,

$$
\begin{equation*}
v^{\varepsilon} \rightarrow v \quad \text { strongly in } H_{0}^{1} \tag{14}
\end{equation*}
$$

Fourth step. The strong convergence of $u^{\varepsilon}$ in $H_{0}^{1}$.
We will first prove that

$$
\begin{equation*}
\lim _{K \rightarrow+\infty}\left(\limsup _{\varepsilon \rightarrow 0} \int_{\left\{\left|u^{\varepsilon}\right|>K\right\}}\left|\nabla u^{\varepsilon}\right|^{2}\right)=0 \tag{15}
\end{equation*}
$$

Thus, let us consider the test functions $u^{\varepsilon}-T_{K}\left(u^{\varepsilon}\right)$ in the first equation in (6). Notice that

$$
\nabla\left(u^{\varepsilon}-T_{K}\left(u^{\varepsilon}\right)\right)= \begin{cases}\nabla u^{\varepsilon} & \text { if }\left|u^{\varepsilon}\right| \geq K, \\ 0 & \text { if }\left|u^{\varepsilon}\right|<K .\end{cases}
$$

Hence,

$$
\begin{gather*}
\int_{\left\{\left|u^{\varepsilon}\right| \geq K\right\}}\left|\nabla u^{\varepsilon}\right|^{2}+\int_{\Omega} \beta\left(v^{\varepsilon}\right)\left(1-T_{K}^{\prime}\left(u^{\varepsilon}\right)\right)\left(X^{\varepsilon}\right)^{\prime}\left(u^{\varepsilon}\right) \cdot \nabla u^{\varepsilon}  \tag{16}\\
=\left\langle f, u^{\varepsilon}-T_{K}\left(u^{\varepsilon}\right)\right\rangle .
\end{gather*}
$$

We can put $\left(1-T_{K}^{\prime}\left(u^{\varepsilon}\right)\right)\left(X^{\varepsilon}\right)^{\prime}\left(u^{\varepsilon}\right) \cdot \nabla u^{\varepsilon}=\nabla \cdot Y_{K}^{\varepsilon}\left(u^{\varepsilon}\right)$, where

$$
\left(Y_{K}^{\varepsilon}\right)_{i}(t)=\int_{0}^{t}\left(1-T_{K}^{\prime}(\theta)\right)\left(X^{\varepsilon}\right)^{\prime}(\theta) d \theta
$$

Thus, the second term in the left hand side of (16) can be written in the form

$$
\int_{\Omega}\left(\nabla \cdot Y_{K}^{\varepsilon}\left(u^{\varepsilon}\right)\right) \beta\left(v^{\varepsilon}\right)=-\int_{\Omega} Y_{K}^{\varepsilon}\left(u^{\varepsilon}\right) \cdot \nabla \beta\left(v^{\varepsilon}\right)
$$

Moreover,

$$
Y_{K}^{\varepsilon}(s)= \begin{cases}X^{\varepsilon}(s)-X^{\varepsilon}(K) & \text { if } s>K \\ 0 & \text { if }\left|u^{\varepsilon}\right| \leq K \\ X^{\varepsilon}(s)-X^{\varepsilon}(-K) & \text { if } s<-K\end{cases}
$$

Since $X \in C_{b}^{0}(\mathbb{R})^{N}$, for $\varepsilon>0$ sufficiently small, $Y_{K}^{\varepsilon}$ is independent of $\varepsilon$ and $Y_{K}^{\varepsilon}\left(u^{\varepsilon}\right)$ is bounded by a constant independent of $\varepsilon$. We also have

$$
\limsup _{\varepsilon \rightarrow 0}\left|Y_{K}^{\varepsilon}\left(u^{\varepsilon}\right)\right| \leq|X(u)-X(K)| \mathbb{1}_{\{u>K\}}+|X(u)-X(-K)| \mathbb{1}_{\{u<-K\}}
$$

for all $K>0$. Therefore,

$$
\left\{\begin{array}{l}
\quad \limsup _{\varepsilon \rightarrow 0} \int_{\left\{\left|u^{\varepsilon}\right|>K\right\}}\left|\nabla u^{\varepsilon}\right|^{2} \leq \int_{\Omega}|X(u)-X(K)| \cdot|\nabla \beta(v)| \mathbb{1}_{\{u>K\}}  \tag{17}\\
\quad+\int_{\Omega}|X(u)-X(-K)| \cdot|\nabla \beta(v)| \mathbb{1}_{\{u<-K\}}+\left\langle f, u-T_{K}(u)\right\rangle
\end{array}\right.
$$

whence

$$
\left\{\begin{array}{l}
\quad \lim _{K \rightarrow+\infty}\left(\limsup _{\varepsilon \rightarrow 0} \int_{\left\{\left|u^{\varepsilon}\right|>K\right\}}\left|\nabla u^{\varepsilon}\right|^{2}\right) \\
\quad \leq \lim _{K \rightarrow+\infty}\left[\int_{\Omega}|X(u)-X(K)| \cdot|\nabla \beta(v)| \mathbb{1}_{\{u>K\}}\right.  \tag{18}\\
\left.\quad+\int_{\Omega}|X(u)-X(-K)| \cdot|\nabla \beta(v)| \mathbb{1}_{\{u<-K\}}\right] \\
\quad+\lim _{K \rightarrow+\infty}\left\langle f, u-T_{K}(u)\right\rangle=0 .
\end{array}\right.
$$

This proves (15). Let us introduce the sets $F_{i, j}^{\varepsilon}$,

$$
F_{i, j}^{\varepsilon}=\left\{x \in \Omega:\left|u^{\varepsilon}-T_{j}(u)\right| \leq i\right\} .
$$

We are now going to prove that

$$
\begin{equation*}
\lim _{j \rightarrow+\infty}\left(\limsup _{\varepsilon \rightarrow 0} \int_{F_{i, j}^{\varepsilon}}\left|\nabla\left(u^{\varepsilon}-T_{j}(u)\right)\right|^{2}\right)=0 \quad \forall i \geq 1 \tag{19}
\end{equation*}
$$

Thus, let us use $T_{i}\left(u^{\varepsilon}-T_{j}(u)\right)$ as test function in the first equation of (6). We obtain

$$
\begin{gather*}
\int_{\Omega} \nabla u^{\varepsilon} \cdot \nabla T_{i}\left(u^{\varepsilon}-T_{j}(u)\right)+\int_{\Omega} \beta\left(v^{\varepsilon}\right)\left(X^{\varepsilon}\right)^{\prime}\left(u^{\varepsilon}\right) \cdot \nabla T_{i}\left(u^{\varepsilon}-T_{j}(u)\right) \\
=\left\langle f, T_{i}\left(u^{\varepsilon}-T_{j}(u)\right)\right\rangle \tag{20}
\end{gather*}
$$

Let us notice that

$$
\nabla T_{i}\left(u^{\varepsilon}-T_{j}(u)\right)=0 \text { in } \Omega \backslash F_{i, j}^{\varepsilon} .
$$

We can then write (20) in the form

$$
\begin{gather*}
\int_{F_{i, j}^{\varepsilon}} \nabla u^{\varepsilon} \cdot \nabla T_{i}\left(u^{\varepsilon}-T_{j}(u)\right)+\int_{F_{i, j}^{\varepsilon}} \beta\left(v^{\varepsilon}\right)\left(X^{\varepsilon}\right)^{\prime}\left(u^{\varepsilon}\right) \cdot \nabla T_{i}\left(u^{\varepsilon}-T_{j}(u)\right) \\
=\left\langle f, T_{i}\left(u^{\varepsilon}-T_{j}(u)\right)\right\rangle \tag{21}
\end{gather*}
$$

Since

$$
\left|u^{\varepsilon}\right| \leq\left|u^{\varepsilon}-T_{j}(u)\right|+\left|T_{j}(u)\right| \leq i+j \quad \text { if } x \in F_{i, j}^{\varepsilon},
$$

we can write $T_{1 / \varepsilon}\left(u^{\varepsilon}\right)=T_{i+j}\left(u^{\varepsilon}\right)$ for all $x \in F_{i, j}^{\varepsilon}$ whenever $\varepsilon$ is sufficiently small. This gives:

$$
\left(X^{\varepsilon}\right)^{\prime}\left(u^{\varepsilon}\right)=X^{\prime}\left(T_{i+j}\left(u^{\varepsilon}\right)\right) T_{i+j}^{\prime}\left(u^{\varepsilon}\right)=X^{\prime}\left(T_{i+j}\left(u^{\varepsilon}\right)\right) \quad \text { in } F_{i, j}^{\varepsilon} .
$$

Thus, for small $\varepsilon>0$, the second term in the left in (21) is

$$
\int_{F_{i, j}^{\varepsilon}} \beta\left(v^{\varepsilon}\right) X^{\prime}\left(T_{i+j}\left(u^{\varepsilon}\right)\right) \cdot \nabla T_{i}\left(u^{\varepsilon}-T_{j}(u)\right)
$$

and converges to

$$
\begin{equation*}
\int_{\Omega} \beta(v) X^{\prime}\left(T_{i+j}(u)\right) \cdot \nabla T_{i}\left(u-T_{j}(u)\right) \tag{22}
\end{equation*}
$$

as $\varepsilon \rightarrow 0$, since

$$
T_{i}\left(u^{\varepsilon}-T_{j}(u)\right) \rightarrow T_{i}\left(u-T_{j}(u)\right) \text { weakly in } H_{0}^{1}
$$

and $\beta\left(v^{\varepsilon}\right) X^{\prime}\left(T_{i+j}\left(u^{\varepsilon}\right)\right)$ is bounded in $\left(L^{\infty}(\Omega)\right)^{N}$ and converges a.e. to $\beta(v) X^{\prime}\left(T_{i+j}(u)\right)$.

Let us introduce $H^{i, j}=\left(H_{1}^{i, j}, H_{2}^{i, j}, \ldots, H_{N}^{i, j}\right)$, with

$$
H^{i, j}(s)=\int_{0}^{s} T_{i}^{\prime}\left(\theta-T_{j}(\theta)\right)\left(1-T_{j}^{\prime}(\theta)\right) X^{\prime}\left(T_{i+j}(\theta)\right) d \theta
$$

Then (22) can be rewritten in the form

$$
\int_{\Omega}\left(\nabla \cdot H_{K}^{i, j}(u)\right) \beta(v)=-\int_{\Omega} H^{i, j}(u) \cdot \nabla \beta(v)
$$

Moreover, it is not difficult to check that

$$
H^{i, j}(u)= \begin{cases}X(i+j)-X(j) & \text { if } j<|u|<i+j \\ 0 & \text { otherwise }\end{cases}
$$

For any $i$, we have $H^{i, j}(u) \rightarrow 0$ a. e. as $j \rightarrow+\infty$. Since X is bounded, $H^{i, j}(u)$ is also bounded. Thus, we obtain from Lebesgue's theorem that

$$
\int_{\Omega} H^{i, j}(u) \cdot \nabla \beta(v) \rightarrow 0 \quad \text { as } j \rightarrow \infty
$$

for all $i \geq 1$. Recalling (20) we see we have proved the following:

$$
\begin{equation*}
\lim _{j \rightarrow+\infty}\left(\lim _{\varepsilon \rightarrow 0} \int_{F_{i, j}^{\varepsilon}} \nabla u^{\varepsilon} \cdot \nabla T_{i}\left(u^{\varepsilon}-T_{j}(u)\right)\right)=\lim _{j \rightarrow+\infty}\left\langle f, T_{i}\left(u-T_{j}(u)\right)\right\rangle \tag{23}
\end{equation*}
$$

On the other hand,

$$
\begin{aligned}
& \lim _{j \rightarrow+\infty}\left(\lim _{\varepsilon \rightarrow 0} \int_{F_{i, j}^{\varepsilon}} \nabla T_{j}(u) \cdot \nabla T_{i}\left(u^{\varepsilon}-T_{j}(u)\right)\right) \\
& \quad=\lim _{j \rightarrow+\infty} \int_{\Omega} \nabla T_{j}(u) \cdot \nabla T_{i}\left(u-T_{j}(u)\right)
\end{aligned}
$$

Consequently,

$$
\begin{gather*}
\lim _{j \rightarrow+\infty}\left(\lim _{\varepsilon \rightarrow 0} \int_{F_{i, j}^{\varepsilon}}\left|\nabla\left(u^{\varepsilon}-T_{j}(u)\right)\right|^{2}\right)  \tag{24}\\
=\lim _{j \rightarrow+\infty}\left(\left\langle f, T_{i}\left(u-T_{j}(u)\right)\right\rangle-\int_{\Omega} \nabla T_{j}(u) \cdot \nabla T_{i}\left(u-T_{j}(u)\right)\right) .
\end{gather*}
$$

Notice that, the terms on the right hand side of (24) can be bounded as follows:

$$
\begin{gathered}
\left\langle f, T_{i}\left(u-T_{j}(u)\right)\right\rangle-\int_{\Omega} \nabla T_{j}(u) \cdot \nabla T_{i}\left(u-T_{j}(u)\right) \\
\leq\left(\|f\|_{H^{-1}}+\|u\|\right)\left\|u-T_{j}(u)\right\|
\end{gathered}
$$

and this converges to 0 as $j \rightarrow+\infty$. Therefore, (19) is satisfied.
We can now prove that $u^{\varepsilon}$ converges strongly in $H_{0}^{1}$. Indeed, obseve that, if $x \in \Omega \backslash F_{i, j}^{\varepsilon}$, then

$$
\left|u^{\varepsilon}\right| \geq\left|u^{\varepsilon}-T_{j}(u)\right|-\left|T_{j}(u)\right| \geq i-j
$$

so that $\Omega \backslash F_{i, j}^{\varepsilon} \subset E_{i-j}^{\varepsilon}$, with

$$
E_{i-j}^{\varepsilon}=\left\{x \in \Omega:\left|u^{\varepsilon}(x)\right| \geq i-j\right\}
$$

Therefore,

$$
\begin{align*}
& \frac{1}{2} \int_{\Omega}\left|\nabla\left(u^{\varepsilon}-u\right)\right|^{2} \leq \frac{1}{2} \int_{F_{i, j}^{\varepsilon}}\left|\nabla\left(u^{\varepsilon}-u\right)\right|^{2}+\frac{1}{2} \int_{E_{i-j}^{\varepsilon}}\left|\nabla\left(u^{\varepsilon}-u\right)\right|^{2} \\
& \quad \leq \int_{F_{i, j}^{\varepsilon}}\left|\nabla\left(u^{\varepsilon}-T_{j}(u)\right)\right|^{2}+\int_{F_{i, j}^{\varepsilon}}\left|\nabla\left(T_{j}(u)-u\right)\right|^{2}  \tag{25}\\
& \quad+\int_{E_{i-j}^{\varepsilon}}\left|\nabla u^{\varepsilon}\right|^{2}+\int_{E_{i-j}^{\varepsilon}}|\nabla u|^{2} \leq 2\left(A_{i j}^{\varepsilon}+B_{i j}^{\varepsilon}+C_{i j}^{\varepsilon}+D_{i j}^{\varepsilon}\right)
\end{align*}
$$

We have seen in (19) that

$$
\begin{equation*}
\lim _{j \rightarrow+\infty} \limsup _{\varepsilon \rightarrow 0} A_{i j}^{\varepsilon}=0 \quad \forall i \geq 1 \tag{26}
\end{equation*}
$$

The second term $B_{i j}^{\varepsilon}$ satisfies

$$
\limsup _{\varepsilon \rightarrow 0} B_{i j}^{\varepsilon} \leq \int_{\Omega}\left|\nabla\left(T_{j}(u)-u\right)\right|^{2}
$$

whence we also have

$$
\begin{equation*}
\lim _{j \rightarrow+\infty} \limsup _{\varepsilon \rightarrow 0} B_{i j}^{\varepsilon}=0 \quad \forall i \geq 1 \tag{27}
\end{equation*}
$$

From (15) we know that

$$
\begin{equation*}
\lim _{j \rightarrow+\infty} \limsup _{\varepsilon \rightarrow 0} C_{i j}^{\varepsilon}=0 \quad \text { as } i, j \rightarrow+\infty, i-j \rightarrow+\infty \tag{28}
\end{equation*}
$$

Finally, this is also true for $D_{i j}^{\varepsilon}$, since $u \in H_{0}^{1}$ :

$$
\begin{equation*}
\lim _{j \rightarrow+\infty} \limsup _{\varepsilon \rightarrow 0} D_{i j}^{\varepsilon}=0 \quad \text { as } i, j \rightarrow+\infty, i-j \rightarrow+\infty \tag{29}
\end{equation*}
$$

From (25) and (26)-(29), we deduce at once that $u^{\varepsilon} \rightarrow u$ strongly in $H_{0}^{1}$ as $\varepsilon \rightarrow 0$.

Fifth step. End of the proof of theorem 1.1.
Let us chose $h \in C_{c}^{1}(\mathbb{R})$ and $\varphi, \psi \in \mathcal{D}$. Multiplying the first equation in (6) by $h\left(u^{\varepsilon}\right) \varphi$ and the second one by $\psi$ and integrating by parts, we obtain:

$$
\left\{\begin{array}{l}
\int_{\Omega}\left(\nabla u^{\varepsilon}+\beta\left(v^{\varepsilon}\right)\left(X^{\varepsilon}\right)^{\prime}\left(u^{\varepsilon}\right)\right) \cdot \nabla\left(h\left(u^{\varepsilon}\right) \varphi\right)=\left\langle f, h\left(u^{\varepsilon}\right) \varphi\right\rangle  \tag{30}\\
\int_{\Omega}\left(\nabla v^{\varepsilon}+\beta^{\prime}\left(v^{\varepsilon}\right) X^{\varepsilon}\left(u^{\varepsilon}\right)\right) \cdot \nabla \psi=\langle g, \psi\rangle
\end{array}\right.
$$

Since $h$ and $h^{\prime}$ have compact support on $\mathbb{R}$, for $\varepsilon$ sufficiently small we have

$$
\left(X^{\varepsilon}\right)^{\prime}(t) h(t)=X^{\prime}(t) h(t), \quad\left(X^{\varepsilon}\right)^{\prime}(t) h^{\prime}(t)=X^{\prime}(t) h^{\prime}(t)
$$

Both functions belong to $\left(C^{0}(\mathbb{R}) \cap L^{\infty}(\mathbb{R})\right)^{N}$. Thus, we can write (30) as follows

$$
\left\{\begin{array}{l}
\int_{\Omega} h\left(u^{\varepsilon}\right) \nabla u^{\varepsilon} \cdot \nabla \varphi+\int_{\Omega} h^{\prime}\left(u^{\varepsilon}\right)\left|\nabla u^{\varepsilon}\right|^{2} \varphi+\int_{\Omega} \beta\left(v^{\varepsilon}\right) h\left(u^{\varepsilon}\right) X^{\prime}\left(u^{\varepsilon}\right) \cdot \nabla \varphi  \tag{31}\\
\quad+\int_{\Omega} \beta\left(v^{\varepsilon}\right) h^{\prime}\left(u^{\varepsilon}\right)\left(X^{\prime}\left(u^{\varepsilon}\right) \cdot \nabla u^{\varepsilon}\right) \varphi=\left\langle f, h\left(u^{\varepsilon}\right) \varphi\right\rangle \\
\left.\int_{\Omega} \nabla v^{\varepsilon} \nabla \psi+\int_{\Omega} \beta^{\prime}\left(v^{\varepsilon}\right) X\left(u^{\varepsilon}\right)\right) \cdot \nabla \psi=\langle g, \psi\rangle
\end{array}\right.
$$

Now, using the strong convergence of $u^{\varepsilon}$ to $u$ in $H_{0}^{1}(\Omega)$, it is easy to pass to the limit in each term of (31); this yields

$$
\left.\left\{\begin{aligned}
\int_{\Omega} h(u) \nabla u \cdot \nabla \varphi+\int_{\Omega} h^{\prime}(u)|\nabla u|^{2} \varphi & +\int_{\Omega} \beta(v) h(u) X^{\prime}(u) \cdot \nabla \varphi \\
\quad & +\int_{\Omega} \beta(v) h^{\prime}(u)\left(X^{\prime}(u) \cdot \nabla u\right) \varphi
\end{aligned}\right)=\langle f, h(u) \varphi\rangle\right)
$$

This completes the proof.
